## Magnetic Seed Localization

Magnetic Seed Localization (MSL) is a new technique to help Radiologists and Surgeons localize impalpable breast lesions.

Magseed® (the size of a grain of rice) is inserted into the lesion under image guidance, up to 30 days prior to surgery. This flexibility simplifies the scheduling of patients, and allows them to go straight to the OR on the day of surgery minimizing delays and enhancing the patient experience.

In the OR Magseed® is located using the Sentimag® probe and can be detected from any direction, regardless of seed orientation. The seed has no moving parts and can't be damaged when implanted. It is still detectable even if accidentally cut during dissection.

During surgery, through a combination of audio and visual feedback, the surgeon can use location of the seed to orientate the specimen and guide dissection.

endomag.

- Seed Size:** 1 mm x 5 mm
- Delivery System:** 18-gauge needle
- Implantation :** Up to 30 days
- Image Guidance:** Ultrasound or Mammography
- Sensing Depth:** 30 mm – greater with palpation
- Sensing Direction:** Detectable from any orientation
- Sensing Accuracy:** Pinpoint to within a few millimeters
- Seed Signal:** No decay in signal over time  
No requirement for tissue contact  
Can't be damaged during placement  
Still detectable if accidentally cut
- Feedback:** Real time audio and visual feedback
- Bracketing:** Seeds 20 mm apart or greater

## About Endomag

Endomag is dedicated to improving the global standard cancer care for everyone, everywhere, by developing a unique clinical platform that uses magnetic fields to power diagnostic and therapeutic devices. Endomag's first approved products form a minimally-invasive surgical guidance system to address unmet needs in work flow efficiency, availability and affordability for surgical oncology.

Sentimag® is the foundation of this system, and is the world's most sensitive handheld magnetic probe. Given its sensitivity, it can detect minute quantities of magnetic material in the body to guide surgeons in a lumpectomy using Magseed®, or to the lymph nodes first in line to drain from a tumor in a sentinel lymph node biopsy using Sienna+®.

Sentimag® launched in 2013 and, along with Sienna+®, has been used in over 15,000 sentinel lymph node biopsies in Europe and Australasia. In that time a number of multi-center clinical trials across Europe have completed. The most recent publication, a meta-analysis, concluded that Sienna+® is "... non-inferior to the standard method [Tc99 + Blue Dye] for SLN detection in patients with clinically node-negative breast cancer"<sup>1</sup>.

Sentimag® and Magseed® have FDA 510(k) clearance and are available in the United States. Sienna+® is limited to investigational use only under an FDA-approved IDE.
